Keyboard backlight

Keyboard sensors detect your hands, turning the backlight on and off. The backlight adjusts automatically to the level of your room light. Bright light and low battery power cause the backlight to turn off, which helps conserve battery power. In bright light, the F5 and F6 keys are disabled.

Automatic backlight control turns off when you use the F5 or F6 keys to adjust backlight intensity. You can restore automatic backlight control by turning the keyboard off then on. If the keyboard is idle for two hours or more, automatic backlight control is restored automatically.

Troubleshooting

- Slide the On/Off switch to Off then to On.

If you’re using custom Bluetooth hardware and software, refer to your product documentation to resolve any Bluetooth issues.
